## Is it time for Identity as a Service?

The concept of security these days goes well beyond insisting on complicated passwords. Are you sure your company is up to the task?

**kim cameron** @Kim\_Cameron 31m

Yes. Right on time. Azure B2C \*is\* Account Management as a Service (AMAS): professionalized account management.

[twitter.com/adamshostack/s...](#)

**adam shostack** @adamshostack  
[@marypcbuk](#) I know you probably don't write the headlines... It might be time for account management as a service. :)

Details

**Mary Branscombe** retweeted **kim cameron** @Kim\_Cameron Exactly. Azure B2C is uses an Identity Experience Engine to go beyond "accounts" to customer relationships.

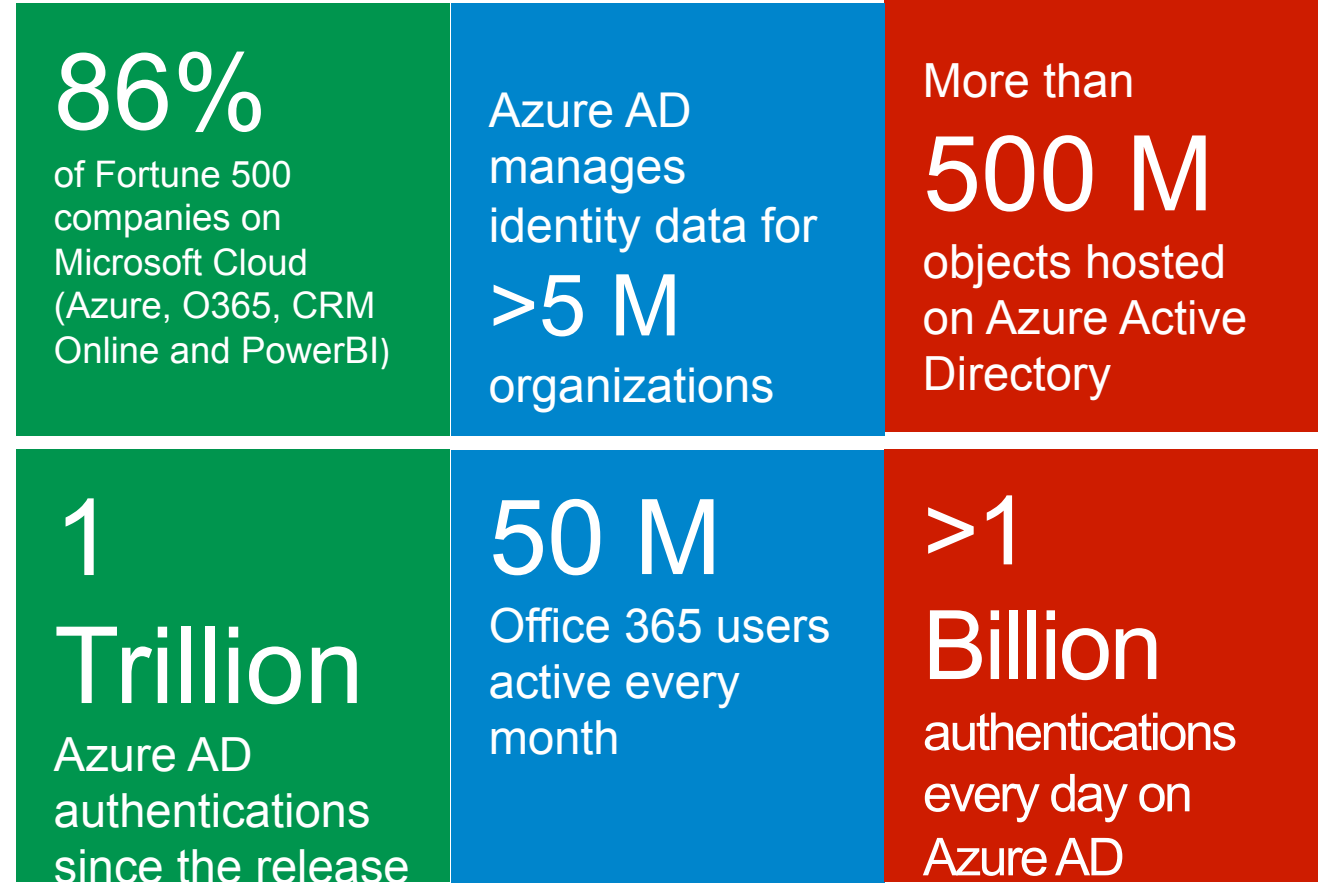

**Mary Branscombe** @marypcbuk @adamshostack I think B2C is a bit broader than just account management; @Kim\_Cameron had a post on more of the policy t'other day

Details

# Professionalizing Identity: IdM

## Services

- *IdM services for enterprises are totally unlike consumer identity systems*
- Example: Azure AD - Microsoft's Identity Management as a Service for organizations
- Millions of **independent** identity systems **controlled** by enterprise and government "tenants"
- Information is **owned and usable by the controlling organization** - not by Microsoft
- Born as an on-premise identity system for employees, has now extended into the cloud
- Has now evolved to manage an organization's relationships with its customers/citizens and partners (B2C and B2B)

# Newest Trend: Professionalization of B2C

So organizations of any size can:

- dramatically reduce **risk**, cost, and complexity
- handle all their different customer relationships within a consistent framework
- grow without limitation
- safely accept all kinds of devices
- gain exceptional control of user experience

# What is different about B2C?

- “What are the differences between the way businesses interact digitally with their customers and the way they interact with their employees?”

Employee

- “Known”
- IT Managed
- Single context
- Not context aware

Customer

- Moves from unknown to known
- Marketing & Sales
- Lowest possible friction
- Fully context aware
- Pay as you go

# What is different about B2C?

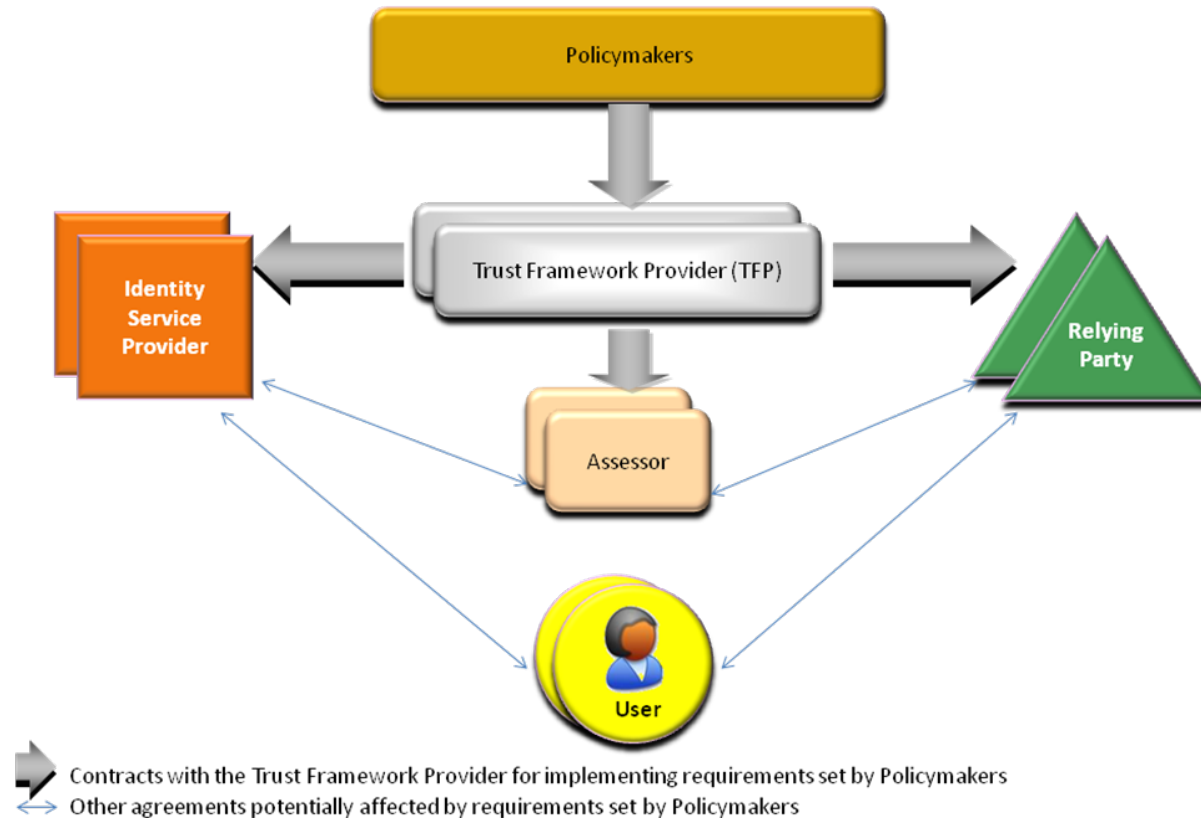

- B2C scenarios demand, above all else, the ability to customize the customer's identity experience to what is right for whatever they are doing.

# Azure AD B2C

- Fully customizable “user journeys” and visuals
- based on an *Identity Experience Engine* **driven by Trust Framework Policies**
- Trust Framework Authors create the policies
- Application developers call the engine and it does **all the heavy lifting**, applying the policy and controlling security

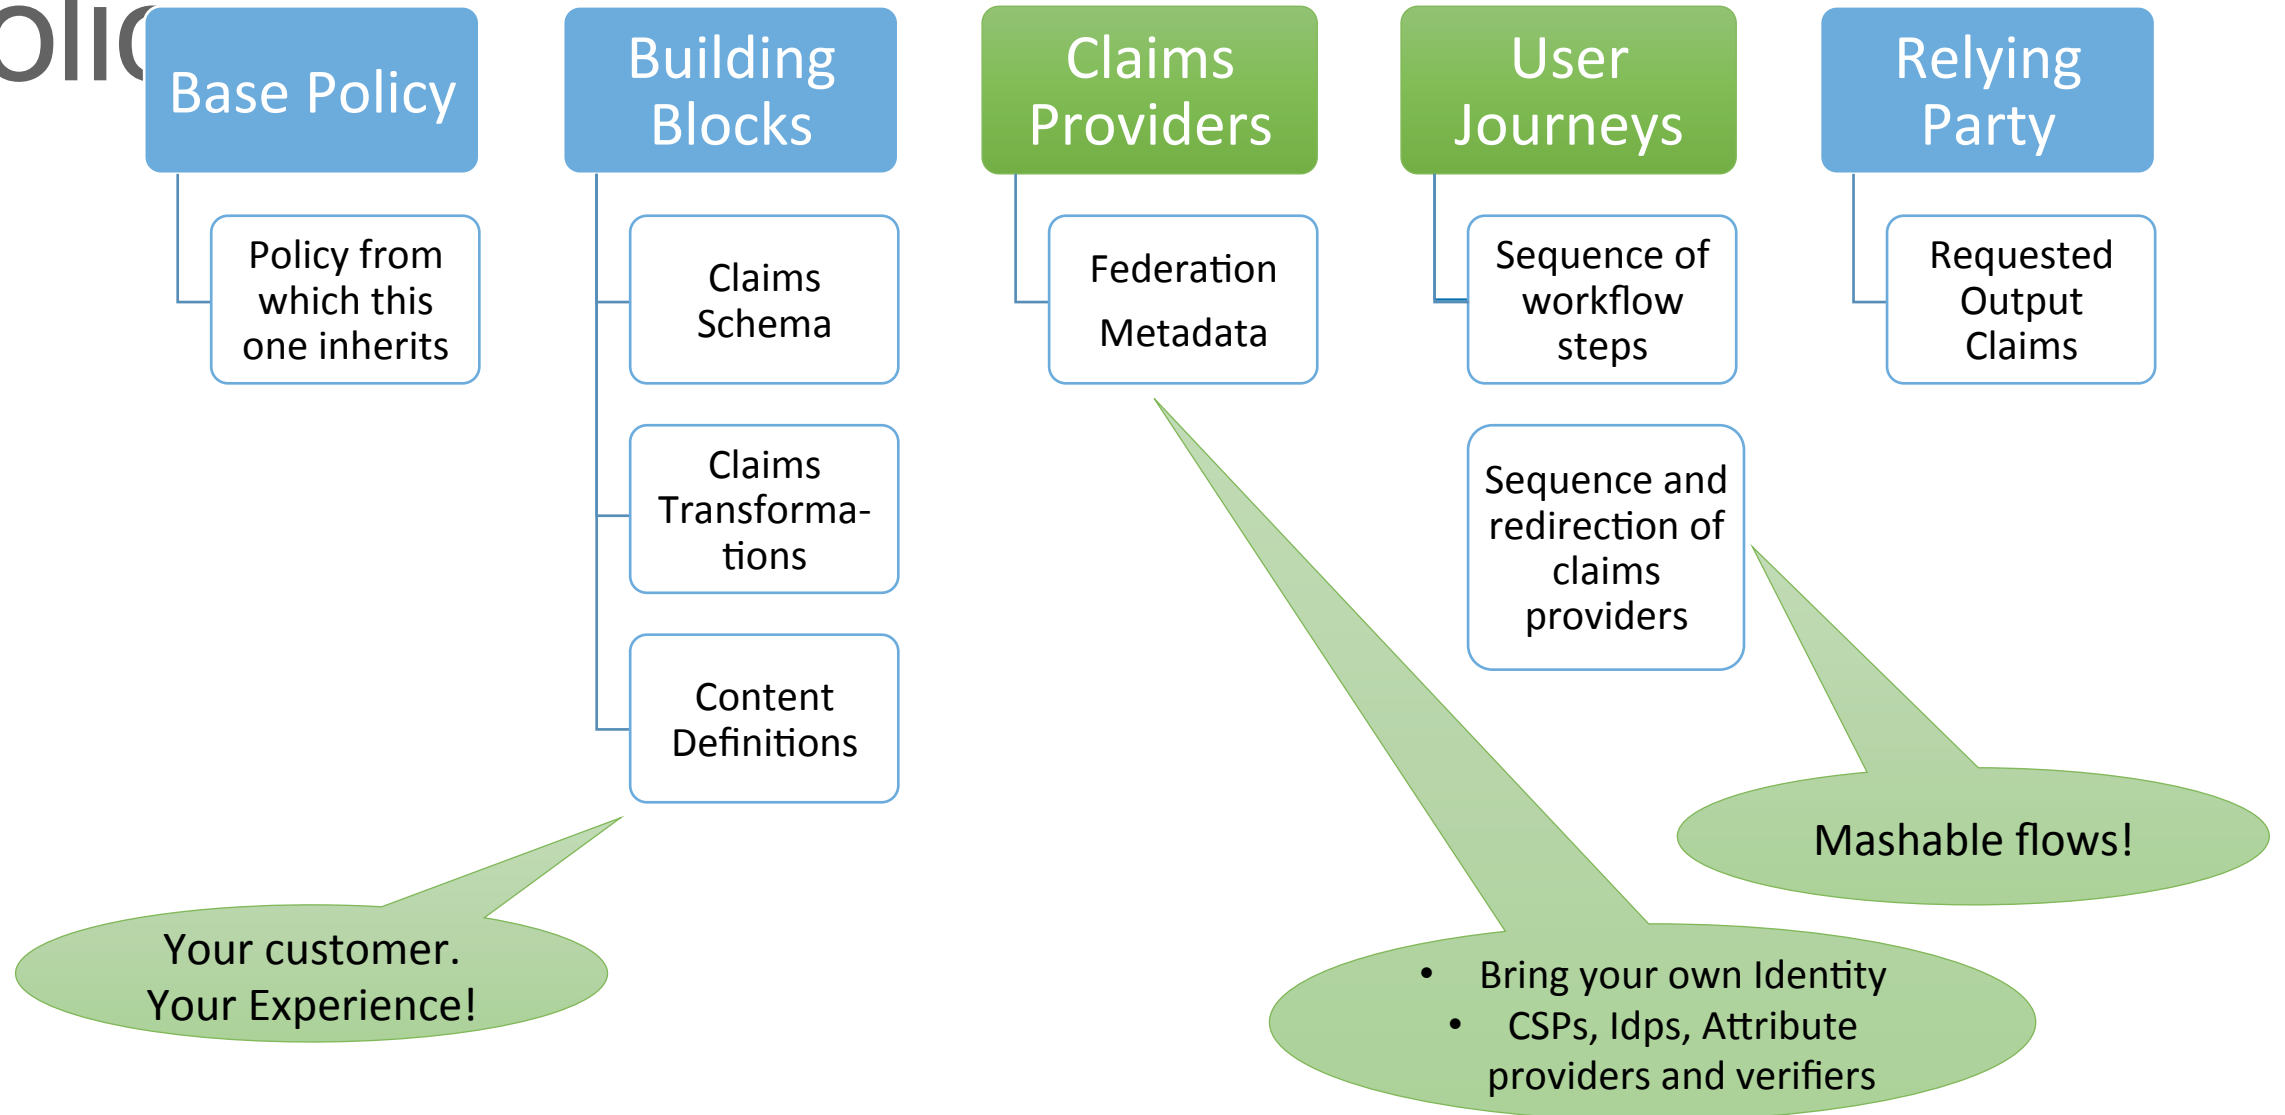

# Trust Framework Policies concretize the tech concepts of Trust Frameworks (OIX)

# Components of a Trust Framework

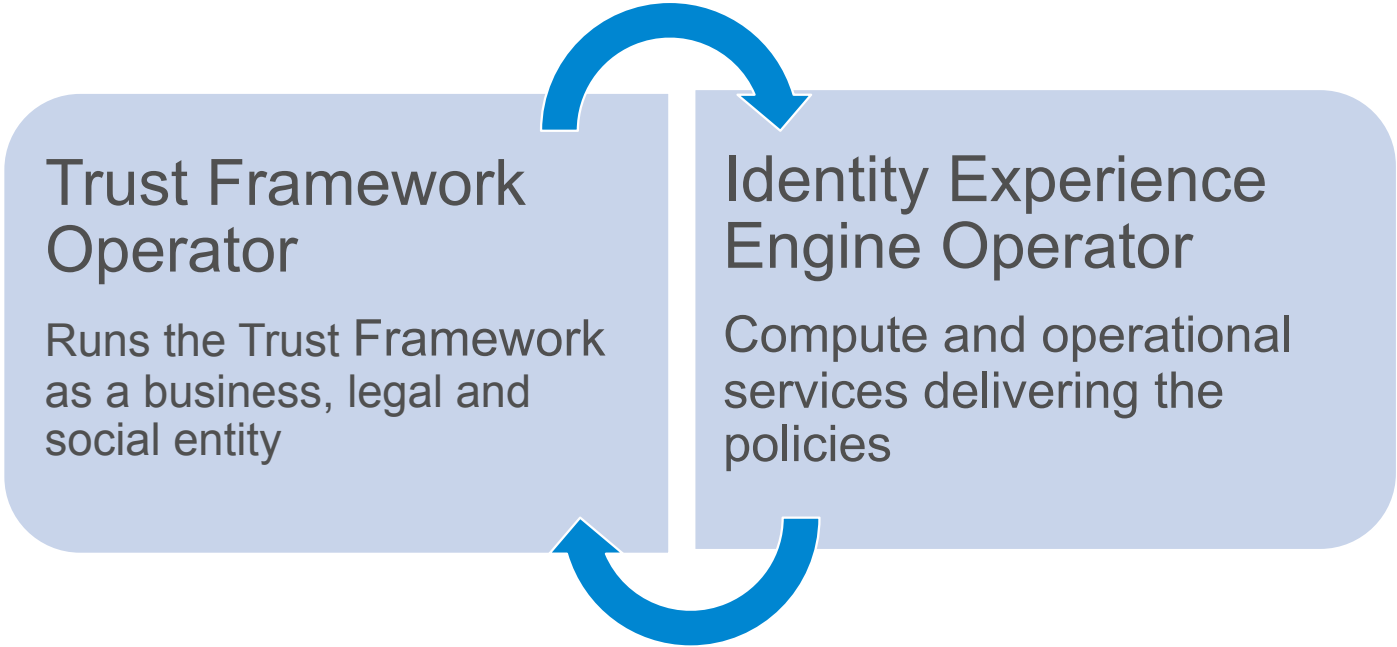

policy

# Trust Frameworks are Useful at Different Levels

- Single application
- Single Organization
- Complex Organization with many divisions
- Horizontal Sets of Organizations
- Vertical Sets of Organizations
  
- Define and document security and privacy behaviors and compliance

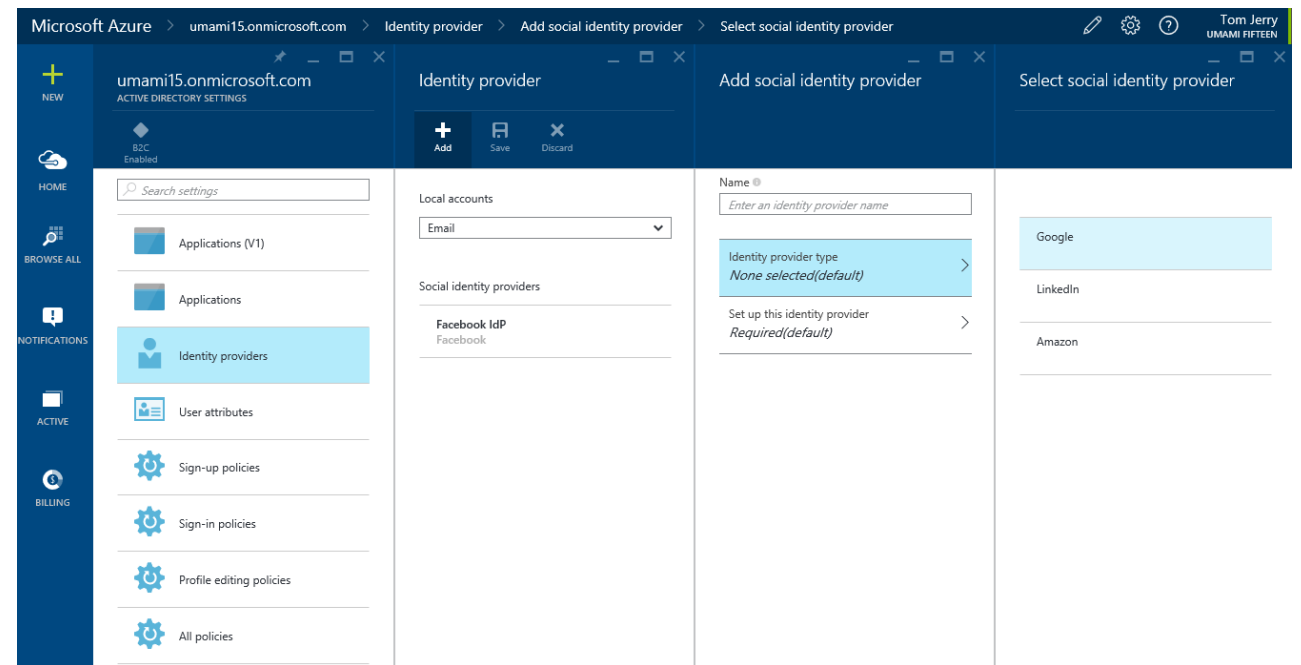

# Cloud era operational model

# B2C Basic – packaged identity experiences

- Meet IDaaS needs of typical apps and enterprises
- ID Providers:
  - top social networks
  - app-specific local accounts
  - phone/email verification
- Simple portal configuration customizes the TF policies for each application
- Enterprise controls “look, feel and content” of user experience
- Engine guarantees the security and privacy of the system
- Upgradable to “advanced” at any time

## LAWS OF IDENTITY POSTER

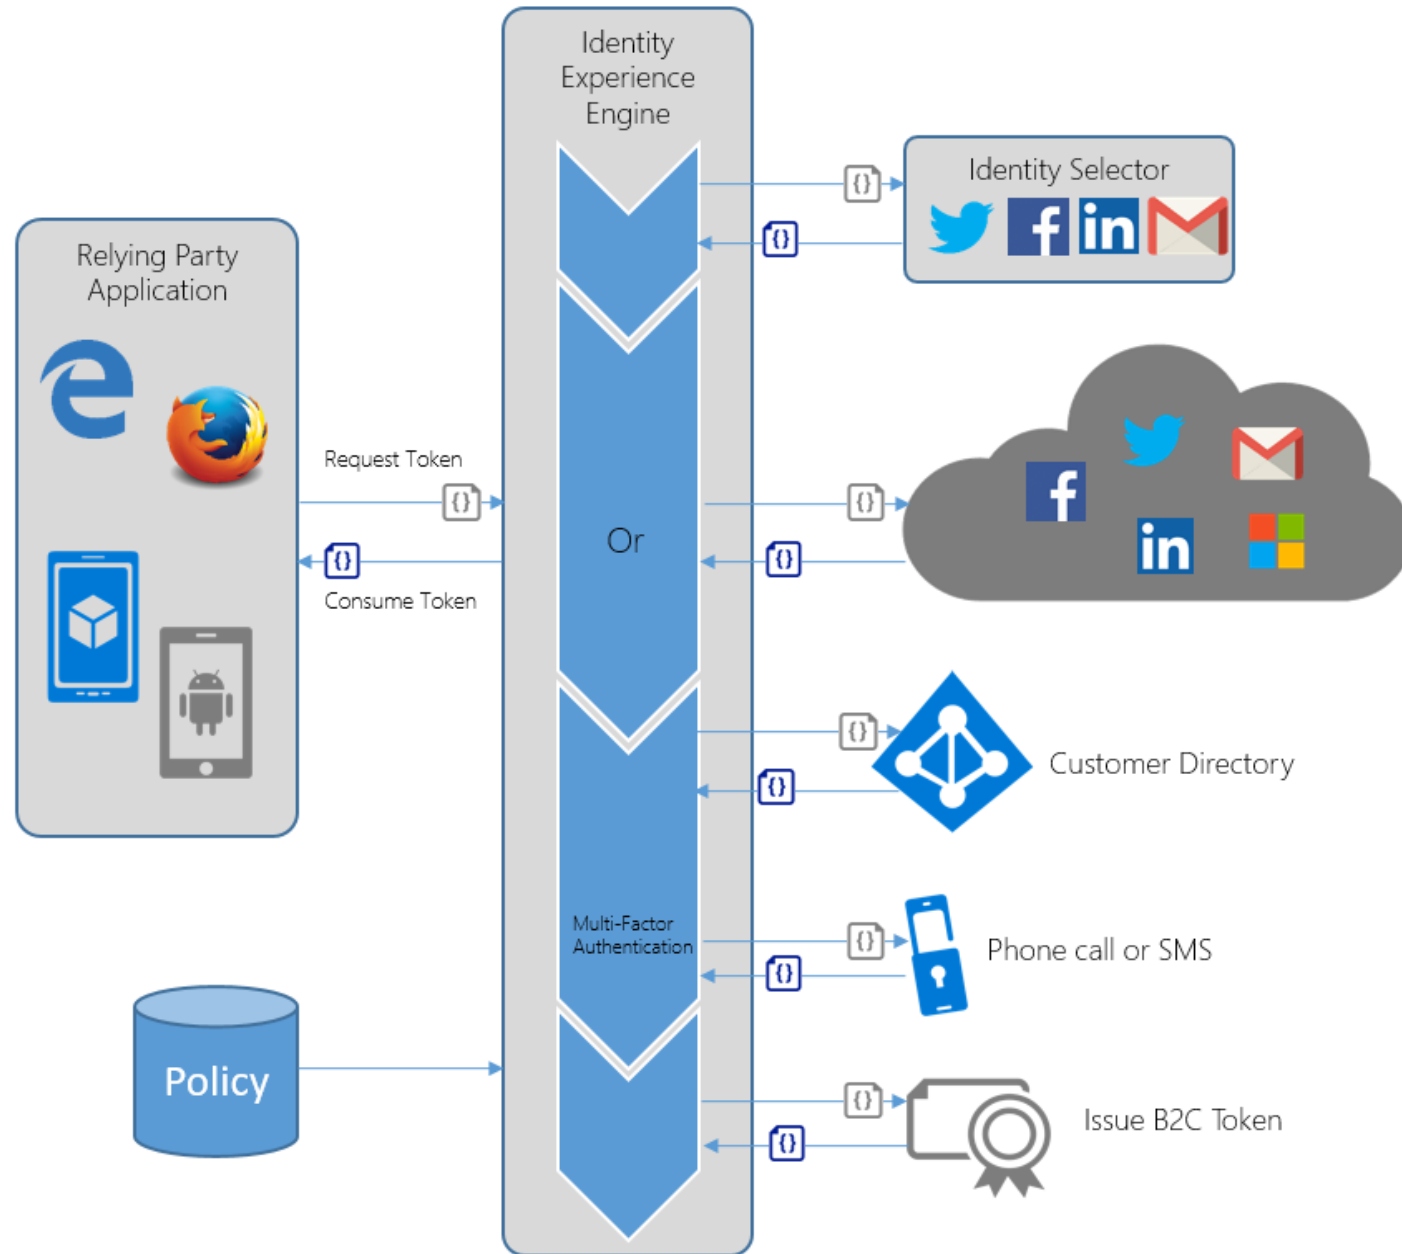

# Lost in translation

It was pretty exciting to start posting again and once more feel like part of the *twitoblogosphere*, or digital reality, or whatever we're calling it. I have to admit to not a small amount of regret for having neglected my blog for so long – in spite of my long list of “excellent reasons” for having done so. I was therefore prepared for a nudge or two from my friends, like Mary Branscombe's:

Sean Deuby and 6 others follow

 **ScaryMary Branscombe** @marypcbuk · Nov 2  
So @alex\_a\_simons got @kim\_cameron to blog again; I'm feeling quite nostalgic ;)

# B2C Premium – create your own trust framework

- All the requirements of an Identity “Hub”
- Ability to manage data on behalf of trust framework members (optional)
- Create your own trust framework through declarative policies

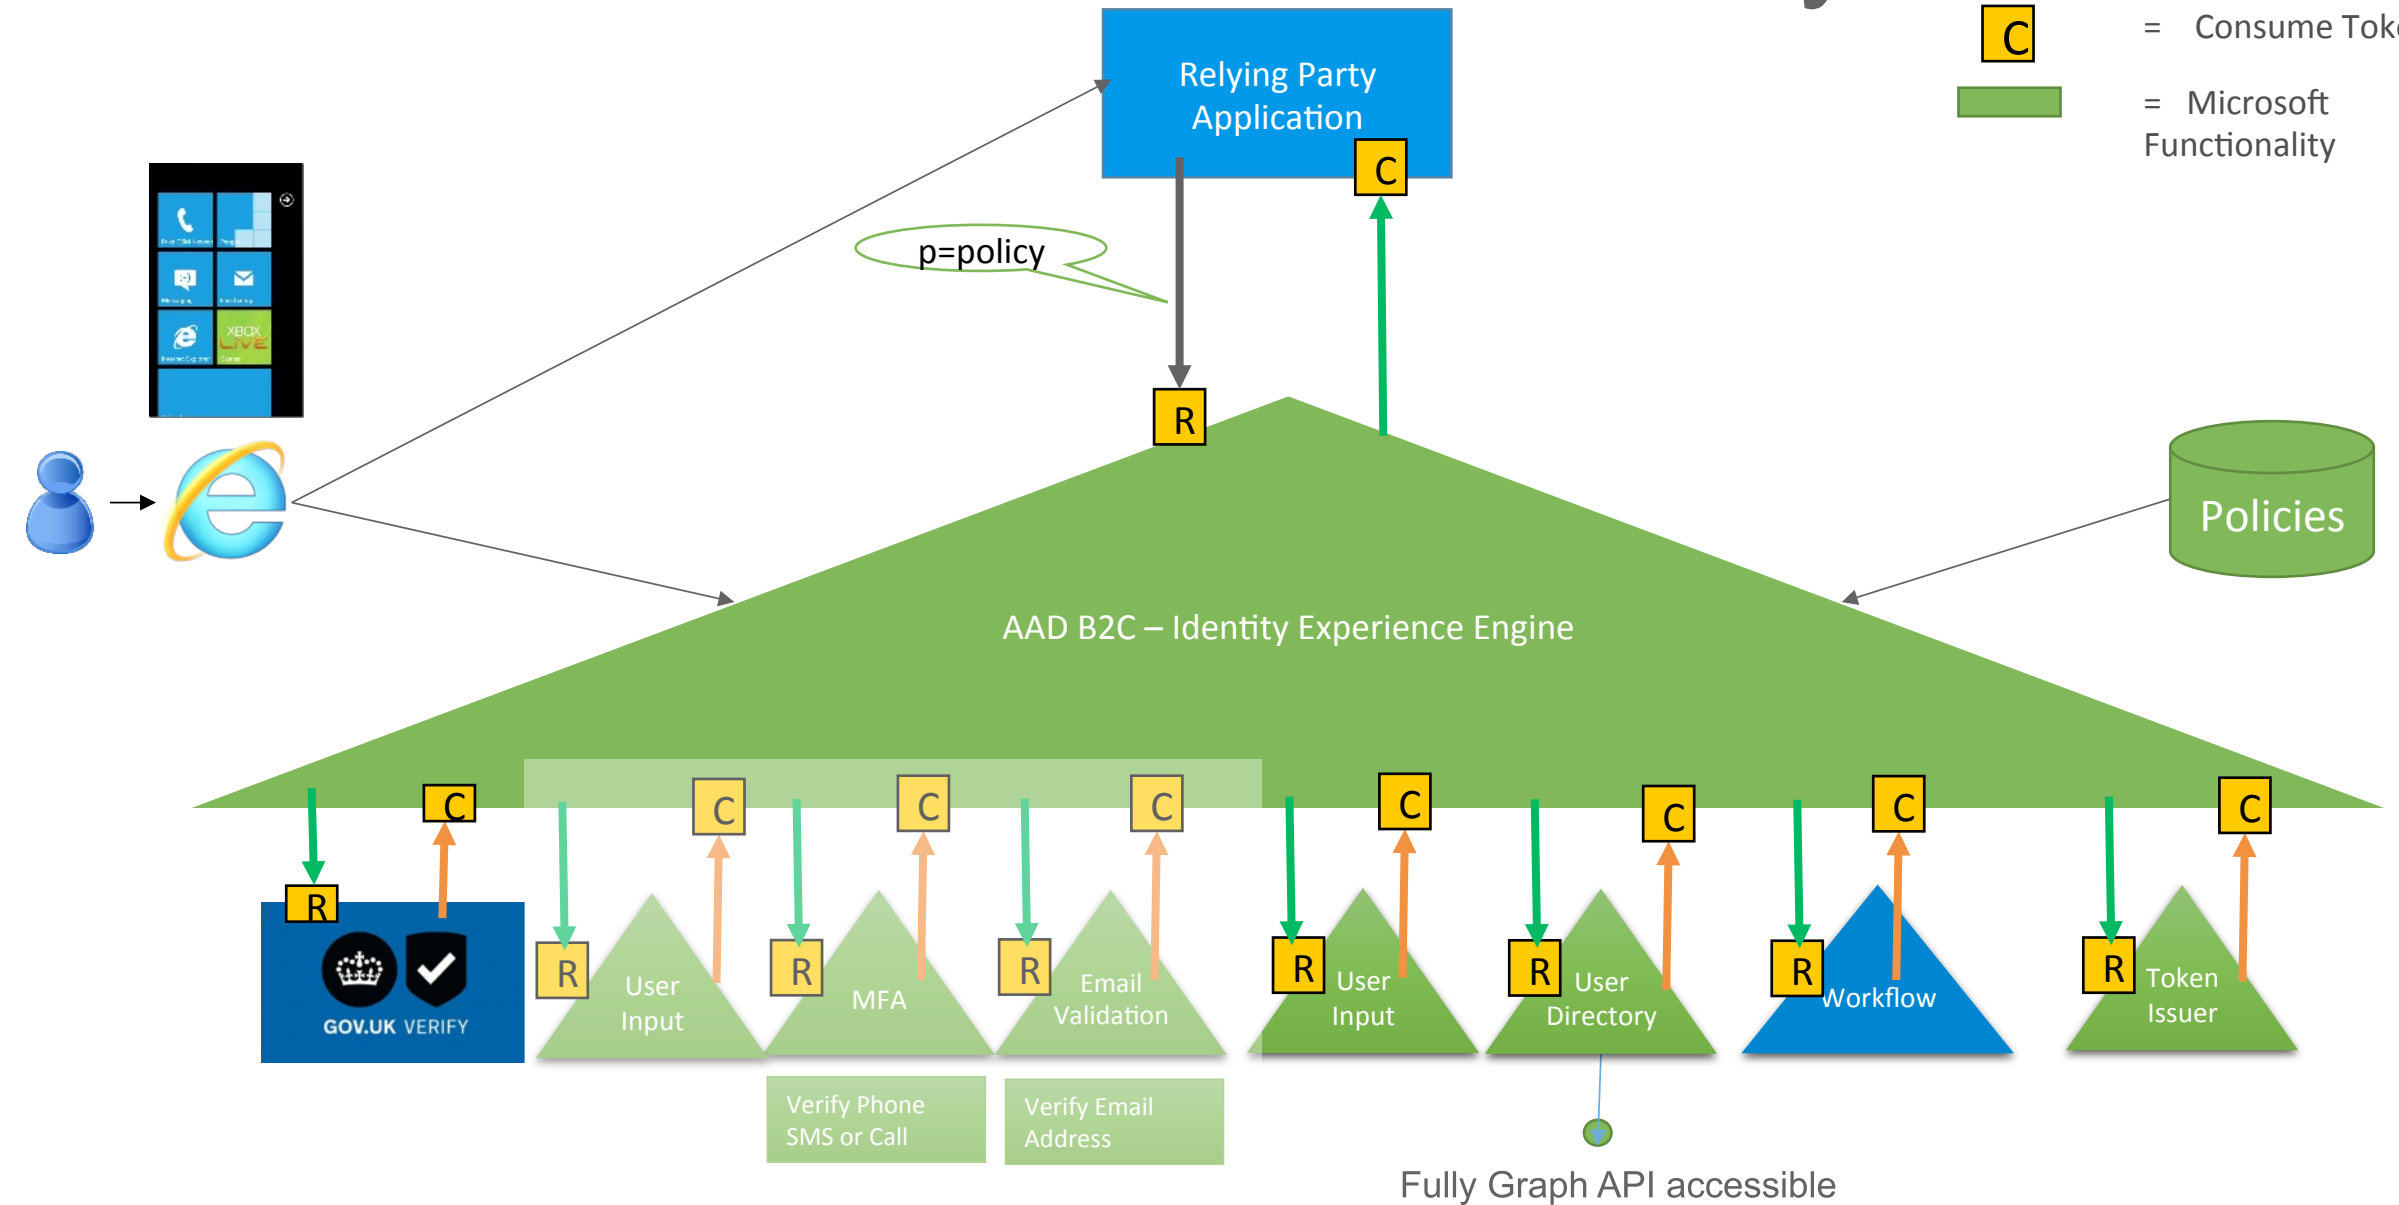

```
<tenantId>public.microsoft.com/</tenantId>
<PolicyId>B2C_1A_base-v1</PolicyId>
</BasePolicy>
<!--Journey-->
<!--User Journey-->
<!--OrchestrationSteps-->
<!--OrchestrationStep-->
<!--OrchestrationStep-->
<!--OrchestrationStep-->
</OrchestrationSteps>
</UserJourney>
</UserJourney>
<!--DefaultUserJourney-->
<!--RelyingParty-->
<!--RelyingParty-->
</RelyingParty>
</TrustFrameworkConfiguration>
```

## Full flexibility to define and configure:

- User Journeys
- Identity Providers
- Relying Parties
- Authentication Requirements
- Multifactor orchestration
- Integration with Claims Verifiers
- Shared Schema and mappings to participants
- Claims Transformations and Data Minimization
- Blinding and encryption
- Claims Storage
- Protocol Conversion (SAML, Oauth2, and OpenIdConnect)

# PremiumTrust Framework Policy

- = Request Token
- = Consume Tokens
- = Microsoft Functionality

# How much will it cost?

- B2C will be charged on a consumption basis. You pay only for the resources you use.
- There will be three meters, billed monthly:
  - Number of user accounts in the directory
  - Number of authentications
  - Number of multi-factor authentications
  - More: [Azure.com pricing page](#).

# How much will it cost?

STORED USER/MONTH	PRICE
First 50,000	Free
Next 950,000	\$0.0011
Next 9,000,000	\$0.0009
Greater than 10,000,000	\$0.0008

AUTHENTICATIONS/MONTH	PRICE
